## GENERAL INSTRUCTION

### HOW TO LOAD MACHINE FOR OPERATION

Remove back door and frame lever "BA" (Photo #5) as far as it will go. Insert coins into coin chute one at a time. Pull handle after each coin is inserted. Load until coin tube and jackpot is loaded. Coins automatically flow into jackpot after coin tube is loaded. When coins start to flow into coin box, both jackpots are loaded, then push lever "BA" (Photo #5) back to its original position. Replace door and machine is ready for operation.

### HOW TO REMOVE MECHANISM FROM CASE

Remove back door. Remove top rear section Code "E" (Photo #1) by lifting catches Code "F" & "G" (Photo #2) then remove two thumb screws located at back right and left side clamps of mechanism base. Raise mechanism clamps "M" & "N" (Photo #2) and slightly raise and pull out mechanism.

When replacing mechanism be sure that operating lever for Code "AB" (Photo #5) is in proper position below handle starting lever, Code "L" (MLB-5936-CSP) (Photo #2). Care should be taken to see that none of the levers or springs are bent or broken as mechanism is being replaced into case. Be sure to securely fasten mechanism into case with thumb screws and by lowering mechanism clamps.

**CAUTION:** To avoid bending jackpot trip lever when inserting mechanism into case, jackpot to be closed and payout slides to be in the out position.

**CAUTION:** When inserting or removing mechanism from case, hold 7-7-7 payout lever (Photo #6 Code XX) out to prevent jamming of 7-7-7 token award chute lever.

### IF JACKPOT FAILS TO DELIVER

When replacing mechanism be sure that jackpot is closed and payout slides are in the out position. See that operating lever Code "AB" (FOK-3297-A-CSP) (Photo #5) is in the proper position below handle starting lever Code "L" (MLB-5936-CSP) (Photo #2).

Check spring Code "AE", "AD" and "AL" (Photo #8) to see if they are stretched out of shape or broken.

See that shoulder screw Code "AM" (Photo #8) does not become tight so as to bind lever Code "D" (Photo #8) from working freely.

### IF RESERVE JACKPOT FAILS TO DELIVER

See that springs Code "AB" and "AE" which operate lever Code "C" (Photo #8) are not broken or stretched out of shape or that screw Code "J" (Dog Point Screw) (Photo #8) does not bind lever Code "H" (Photo #8).

See that lever "XX" (Photo #8) drops down to engage in notch of push bar Code "T" (Photo #4) after jackpot is delivered.

The correct operation of reserve jackpot is as follows: On next play following jackpot lever "XX" (Photo #8) is engaged with push bar Code "T" (Photo #4) and push bar Code "T" then starts to travel forward and at the same time spring Code "AA" (Photo #8) causes lever Code "C" (Photo #8) to fall behind reserve locking lever Code "F" (Photo #8) and jackpot will close and reserve jackpot will open as handle is pulled down. Reserve jackpot will stay open until next play when lever Code "D" (Photo #8) engages into notch of push bar Code "T" (Photo #4). Then push bar Code "T" travels forward and releases operating lever dog Code "C" (Photo #8) to close reserve jackpot.

### WHEN MECHANISM FAILS TO DELIVER PROPER NUMBER OF COINS

If mechanism delivers too many coins at intervals, the trouble in most cases is that a few thin or undersize coins have been played in succession and stacking up in your coin tube they do not cover correct area of standard size coins.

If mechanism repeatedly pays out too many coins or pays short, or does not pay at all, check up payout mechanism thoroughly as follows: First see that there are plenty of coins in coin tube and that they lay flat in tube. Examine payout slides (Photo #3) to see that coins are not wedged in opening. This would prevent machine from paying out. If coins are wedged in payout slides, unhook springs from bracket Code "H" (Photo #6) remove payout slide stop Code "D" (Photo #3) then remove payout slides and examine bronze springs to see that they are not loose. If so, reset same and see that they are level with outside runner of payout slides. Ends of bronze springs are formed up about 1/8 inch and are intended to prevent coins from slipping between slides. If formed end of bronze spring is broken off it should be replaced.

When replacing payout slides back into mechanism, slides and coil springs must be replaced in order removed. If coil springs are stretched or detached lever cannot be pulled in proper position for payout.

Examine perpendicular levers Code "A, C, E, G, J, & L" (Photo #5) and coil springs Code "B, D, F, H, K, & M" (Photo #5) to see that levers are not bent and springs are not stretched or detached.

See that payout slide push bar Code "AF" (Photo #3) moves payout slides forward about 1/8 inch beyond payout slide stop lever Code "AH" (Photo #3). This will let payout slide stop lever to swing inward and stop slides from going in against lower payout levers Code "U, W & T" (Photo #6) when reels begin to revolve. Timing lever Code "AW" (Photo #3) thus will start traveling backward from action of clock spring Code "G" (Photo #6) and lock lever Code "AH" (Photo #6) will release payout slides as timing lever releases disc stop levers Code "A, B, & C" (Photo #4) and cause them to fall against reel stop stars.

See that spring Code "AC" (Photo #3) which connects payout slide push bar Code "AF" (Photo #8) with operating fork is not stretched or broken.

### HOW TO DRAIN CONTENTS OF MACHINE

Remove back door. Hold coin detector operating lever Code "S" (Photo #5) with finger to keep it from traveling forward as handle is pulled down. When handle is pulled down reels will start to spin, then move lower payout slide stop levers Code "R, S, & T" (Photo #6) with finger slightly to the left. Thus disengaging said levers from payout slide. This action will cause 20 payout and jackpot to deliver. Keep repeating same operation until machine is empty.

#### IF REELS FAIL TO REVOLVE

See that grab hook on arm of reel operating lever Code "F" (Photo #3) travels upward and along edges of all three large steel reel discs until it drops into notches properly. This grabbing action sets reels in motion when operating fork dog Code "AE" (Photo #5) releases from Fork stop pin Code "BG" (Photo #5 as handle is pulled down.

See that disc stop lever Code "AR" (Photo #3) prevents discs from moving before grab hook Code "F" (Photo #3) sets reels into motion, and that disc stop lever Code "AR" (Photo #3) swings back to give reels room to revolve.

Be sure clock assembly Code "F" (Photo #6) which is the timer for mechanism is in good working order and operates freely.

See that clock spring Code "G" (Photo #6) is not stretched out of shape or broken.

#### HOW TO ADJUST SPEED REELS

Careful attention in adjusting speed of reels should be taken. Improper adjustments might result in serious damage. If reels spin too fast and stop with jarring bounce, tighten brake spring Code "X" (Photo #6). The reels then should stop at about the same time that reel stop levers Code "A, B, & C" (Photo #4 fall against reel stop stars. To speed up reels, bend ends of clock fan on clock Code "F" (Photo #6. To slow up reels straighten out ends of above mentioned clock fan.

#### HOW TO REMOVE REELS ASSEMBLY FROM MECHANISM

Remove mechanism from case.

Play machine by holding coin detector lever Code "S" (Photo #5) back to keep it from traveling forward. Play mechanism thru by operating main operating lever Code "AB" (Photo #5).

When reels spin stop clock fan, hold clock fan by laying a screw driver across operating fork and clock fan.

Remove reel brake wires Code "X" (Photo #6). Loosen shoulder screw Code "J" (Photo #4). Unscrew and remove reel shaft Code "H" (Photo #4) lift reels upward and from machine.

To replace reels reverse the above mentioned process.

After reels are replaced, shaft and shoulder screw Code "J" are to be tightened. Reel brake wire adjusted. Operate main operating lever Code "AB" (Photo #5) thru to spin reels to check for proper spinning of reels. See how to adjust speed of reels.

#### HOW TO REMOVE REEL OPERATING LEVER ASSEMBLY

To remove reel operating lever assembly Code "F" (Photo #3) from mechanism assembly, remove coin tube assembly Code "X" (Photo #4). Unhook extension spring Code "H" (Photo #3) at bracket Code "H" (Photo #6) turn grab hook towards front of mechanism so that top end of grab hook clears reel discs - slip grab hook off stud holding assembly.

To assemble grab hook to mechanism reverse the procedure followed above.

**CAUTION:** When replacing coin tube assembly, be sure that coin overflow push out lever Code "U" (Photo #3 is in slot at upper end of coin tube.

Failing to follow the above instructions will result in jamming coin tube.

Mills Bells are sufficiently lubricated when they are shipped to take care of heavy working parts for six months. When necessary to lubricate heavy working parts use vaseline in spots where friction is created.

Bearings should be oiled every six months with best grade sewing machine oil.

Clean clock works frequently with gasoline to remove grit from teeth of pinions. Put a few drops of 3-in-1 oil or any good grade sewing machine oil on each pinion. Do not use a cheap, heavy lubricating oil for this purpose.

Under no circumstances should pay-out slides be oiled or greased as this will cause them to stick. Slides should be cleaned frequently with gasoline and see that they are kept free from dirt at all times.

All springs, screws, nuts and levers should be inspected occasionally to see that they are in perfect operation.

Before making any adjustments for any troubles which may arise, first check to see that all springs are in place and are not deformed, or broken. Also check to see that all screws are tight. If screws are found loose and they control an adjustment then that particular adjustment must be checked before tightening screws per General Instructions.

#### HOW TO CLEAN COIN CHUTE

Lint and dirt from player's pocket gather on coins and when inserted into chute sometimes cause coin chute to stick or clog. To clean chute, remove mechanism from case (see paragraph "HOW TO REMOVE MECHANISM FROM CASE"), then remove 3 red painted screws which are used to mount coin chute to case. Remove front plate of chute, mounted with machine screws, and then clean chute with gasoline and a small fine brush. After gasoline has evaporated, replace front plate and screws and mount coin chute back into case.

# PHOTO-#1

This diagram provides a detailed view of the exterior components of a vintage slot machine, including coin slots, a handle, a case, and a money bowl.
